DOPENOTCH AI FOR MACOS · VERSION 0.4.1 (UNIVERSAL 2)

# Install DopeNotch AI in a few steps.

Keep this guide open while you install. You can read it before downloading, save it offline, or print it.

**100% Safe & Offline-First — Why macOS shows a first-launch prompt**

DopeNotch AI is built by an independent macOS studio and runs **100% locally on your Mac** (your voice dictations, clipboard history, and files never leave your device). While our annual Apple Developer ID notarization is being finalized, macOS displays a standard prompt the very first time you open a direct web download. Approve it once in 10 seconds and DopeNotch AI launches normally forever after.

Download DopeNotch AI only from the official page at https://dopenotch.xbuilds.online/DopeNotch.dmg.

SUPPORTED MACOS & CHIPS

**macOS 13.0+ (Sonoma 14.0+ recommended)**
Universal 2 (Apple Silicon `arm64` & Intel `x86_64`)

OFFICIAL INSTALLER PACKAGE

**DopeNotch.dmg** (10,519,196 bytes)
Bundle ID: `com.dopenotch.ai`

SHA-256 CHECKSUM (V0.4.1)

`55510e7dbb7f28fac2c9c66648fbfe94c8671978a39825a6d40f8aa311864fd2`

## 1. Move DopeNotch AI to Applications

Open the downloaded `DopeNotch.dmg` disk image. If an older copy of DopeNotch AI is running, quit it first from the menu bar icon. Drag **DopeNotch AI.app** into your **Applications** folder.

Always open DopeNotch AI from your **Applications** folder (`/Applications/DopeNotch AI.app`), rather than launching it directly from inside the mounted disk image.

## 2. First open: two safe ways to approve the app

Because this build is not notarized by Apple, double-clicking it the first time may show a macOS prompt saying *“DopeNotch AI.app Not Opened — Apple could not verify DopeNotch AI.app is free of malware.”*

### Method A — Right-click Open from Applications (macOS 13 & 14)

1. Open Finder and go to your **Applications** folder.
2. **Control-click (or Right-click)** on **DopeNotch AI.app** and choose **Open** from the context menu.
3. If macOS shows a dialog with an **Open** button, click **Open**. If macOS only shows **Done** and **Move to Trash** (standard on macOS Sequoia 15+), click **Done** and use Method B below.

### Method B — Approve in System Settings → Privacy & Security (macOS 14 & Sequoia 15+)

1. When macOS shows the *“DopeNotch AI.app Not Opened”* alert, click **Done** (do not click Move to Trash).
2. Open **System Settings → Privacy & Security** and scroll down to the **Security** section.
3. Locate the message stating that **“DopeNotch AI.app” was blocked to protect your Mac** and click **Open Anyway** beside it.
4. In the confirmation prompt, click **Open Anyway** (or **Open**).
5. macOS will ask for your administrator Touch ID or login password. Enter it **only in the authentic macOS system prompt**.

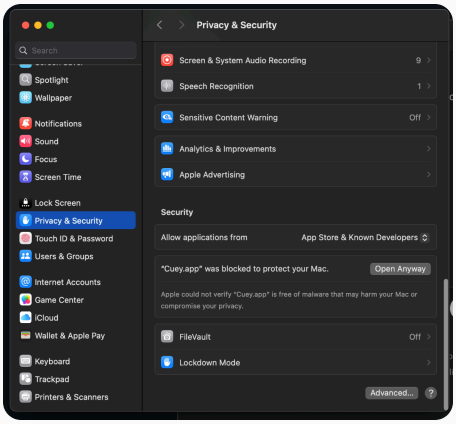

**1. Click “Done” on the initial prompt**

Do not click Move to Trash — simply click Done so macOS registers the launch attempt.

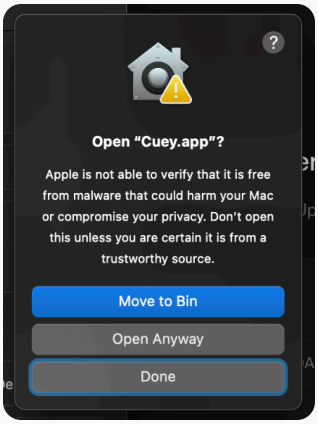

**2. System Settings → Privacy & Security**

Scroll down to the Security section and click “Open Anyway” next to the blocked notice.

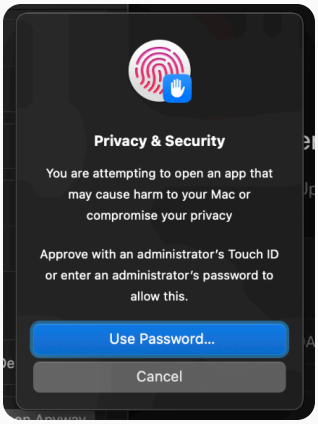

**3. Confirm “Open Anyway”**

Click “Open Anyway” on the confirmation sheet.

**4. Approve with Touch ID or Mac password**

Use Touch ID or your login password to finish this one-time approval.

*Note: The example screenshots above show the exact macOS Sequoia dialogs (illustrated with our sister app Cuey). You will see “DopeNotch AI.app” in the same place.*

You do **not** need to turn off Gatekeeper, FileVault, or System Integrity Protection. After this one-time approval, DopeNotch AI will open normally from Applications or Spotlight.

## If the warning is different, stop

If macOS says the app **will damage your computer**, reports detected malware, says the file is **damaged or modified**, or if the file’s SHA-256 checksum does not match the official release above, **do not open it**.

Delete the downloaded file immediately and contact dopenotch@xbuilds.online with your macOS version and the exact alert text. Never enter your Mac password into any website, support chat, or email.

Read Apple’s official guidance on safely opening apps on your Mac →

## 3. Optional permissions on first run

DopeNotch AI runs locally on your Mac and only requests macOS permissions for the features you choose to use:

- **Microphone:** Required for on-device Whisper speech-to-text voice dictation and ambient meeting notes.
- **Accessibility:** Required to paste dictated text or clipboard items directly into your active window (`⌘V` automation) and to snap/tile windows (`/left`, `/right`, `/max`).
- **Screen Recording:** Optional — used only when you invoke the Screenshot Snip tool (`/snip`), Screen Text Grabber OCR (`/ocr`), Color Eyedropper (`/color`), or AI Screen Vision.

You can review, grant, or revoke any of these permissions at any time inside **DopeNotch Dashboard → Preferences** or in **macOS System Settings → Privacy & Security**.

## 4. Local storage, licensing & updates

**Where your data lives:** Your workspace files, notes, and stashed assets are stored locally in `~/Documents/DopeNotch`, and app settings, local Whisper models, and license state are stored in `~/Library/Application Support/com.dopenotch.ai`.

**Community Free vs. Pro:** DopeNotch AI starts in **Community Free** mode (up to 25 clipboard history items and 50 local voice dictations per day) with no credit card required. If you purchased a **DopeNotch Pro** license via Polar.sh, open **DopeNotch Dashboard → Preferences → License** and paste your license key to unlock unlimited history and dictations.

**Updates:** New releases are published at dopenotch.xbuilds.online. To update, quit DopeNotch AI, drag the new copy into **Applications**, and replace the older version.

**Need help?**

Email dopenotch@xbuilds.online with your macOS version, chip type (Apple Silicon or Intel), and the exact alert text. Never send passwords or private API keys.
